● Soft and hard matter high-resolution neutron spectroscopy at the Australian Centre for Neutron Scattering.

Nicolas R. de Souza

Australian Nuclear Science and Technology Organisation (ANSTO).

The Australian Centre for Neutron Scattering operates a suite of 15 neutron instruments distributed across the thermal- and cold-sources of the OPAL reactor, ANSTO. Two of the cold instruments are optimized for quasielastic neutron scattering (QENS) measurements.

This presentation will highlight the scientific capabilities of the Emu backscattering spectrometer enabling access to microscopic, molecular dynamics up to about 5 ns time scale. Investigations of diffusive processes in organic make up the bulk of applications with that technique, while nuclear hyperfine splitting and quantum rotational tunneling studies are also possible.

A few examples from biophysics and polymer science will be presented [1,2]. There is also growing interest in understanding transport-related diffusion in inorganic materials related to energy applications, such as ionic conductors [3]. In addition to fully-fledged QENS studies, elastic- and inelastic- fixed window scans add versatility to backscattering spectroscopy, as further illustrated by a handful of recent high impact studies [4]. Finally, complementarity with other techniques, available ancillary equipment, and beam-time access will be discussed.
